DEMO

What does it do?

- Suggests the **five best-unwatched** movies
- Considers **trust** relationships
- Takes only **two seconds**

In this study,

- Gonul and Yavuz Score
- Case studies
- The FilmTrust dataset

ratings.txt

- 35496 triples (**user**, **movie**, **rating**)
- Each user is a unique integer
- Each movie is a unique integer
- Rating between **0-4**

trust.txt

- 1852 triples (**user1**, **user2**, **trust**)
- Trust is **boolean**

Figure: An example Trust Graph (on the left) for an arbitrary movie m and its bounded version (on the right) w.r.t. the user u

Scoring Functions

- **Naive Score:** Average of all ratings
 - Not good
- **Yavuz Score:**

$$Y_u(m) = s_{1,m}(u) + \lambda s_{2,m}(u) + \lambda^2 \sum_{n=3}^{\infty} s_{n,m}(u)$$

- **Gonul Score:**

$$G_u(m) = \begin{cases} s_{1,m}(u) + \lambda s_{2,m}(u) & |\{k : N_{u,m}(k) = 1\}| > 0 \\ \lambda^2 s_{\infty,m}(u) & o/w \end{cases}$$

- $\lambda = .5$ decay factor

- Separate from previous project
 - We assume
 - **Already decided** to watch a movie
 - The schedule is **already planned**
 - **Nothing to interrupt**
- Gonul Score is the most **reasonable**
 - A matter of taste and culture
- A friend can **also be a friends' friend**
 - Count as friend

How to improve when there are no friends?

- Existence of **correlation** between user ratings
- **Ranks** friends

Genre choices

- **CiaoDVD** dataset includes genres
- Integrate **genre choices**
